This Air Quality Project

England Air-Quality Evidence Observatory

Academic and scientific appraisal dossier

Review period: 2026-09-12 to 2026-10-11. Descriptive monitoring evidence for independent scrutiny, reproduction and appraisal.

Abstract

The accepted review identified 172 active English AURN sites and 141/143 configured pollutant-monitor stations reporting across 9/9 English regions. It retained 9,722 valid pollutant-day observations at 97.6% configured-stream completeness.

Headline descriptive metrics

Metric	Value
Active AURN sites discovered	172
Reporting / configured stations	141/143
English regions represented	9/9
Valid pollutant-day observations	9,722
Unique station-days	4,216
Configured-stream completeness	97.6%
Contextual reference-value pollutant-days	270
England network coverage gate	pass

Scientific interpretation boundary

These outputs are descriptive and screening evidence. They do not establish source contribution, causation, personal or population exposure, health diagnosis or quantified health impact, breach of a permit condition, legal non-compliance or a regulatory determination. Contextual health-based reference values are not UK legal exceedance counts.

Reproducibility and external review

The accompanying data, station registry, data dictionary, methods, source audit, cross-reference audit, release contract and checksum manifest are supplied so that reviewers can reproduce calculations, inspect denominators and provenance, and submit methodological criticism or corrections.

Contents of the submission bundle

Data: pollutant-day evidence, AURN station registry and data dictionary. Methods: public methods and coverage standard, scientific assurance standard, external-review protocol and traceability. Provenance: source-coverage audit, cross-reference audit, release contract and England coverage gate. Communication: deterministic particulate social package where available. Manifest: file-level SHA-256 checksums and byte sizes.

External endorsement

No external scientific endorsement is claimed by this dossier. It is prepared for independent analysis, appraisal, criticism, correction and reproducibility review.
